

# Onyx & OSX Automator

Harnessing the power of AppleScript & Automator on OSX Tiger to improve the production workflow in a cross-platform computing environment.

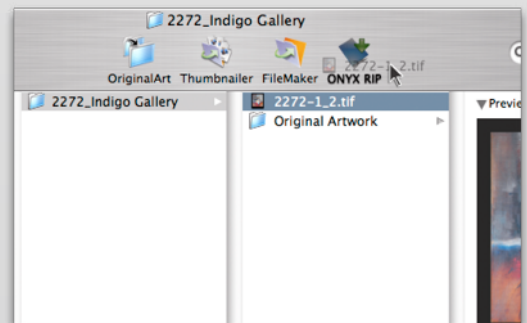

## Step 1: Sync the Mac with Onyx

AppleScript is used to automatically discover all printers and their corresponding hot folders on the Onyx PC. If new printers and/or hot folders are added to Onyx the Mac will automatically become aware of them and they will be added to the workflow.

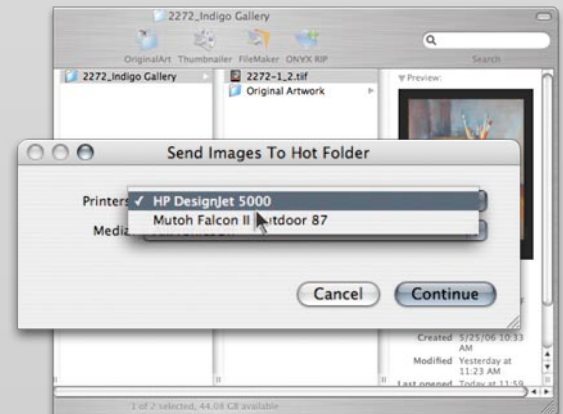

## Step 2: Printing files with drag & drop ease

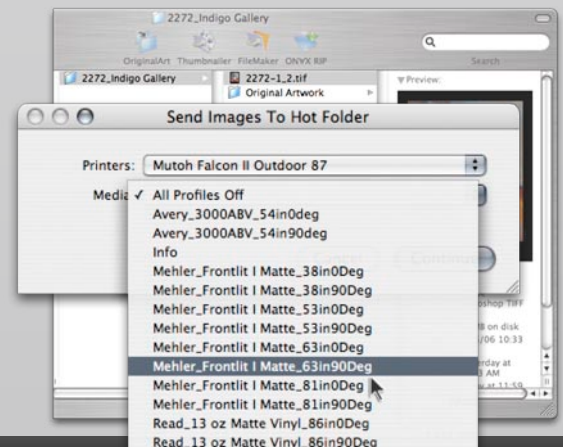

Using the Finder to select all the files to be printed the user drags and drops them onto the Finder tool-bar icon as shown in the image to the right.

After verifying that the files being sent are in fact images that Onyx can process the user is prompted to choose the target printer.

Finally the user is prompted to choose from the available hot folders for the selected printer.

The result is all files being placed into the selected hot folder exactly as if they had been dragged and dropped from the PC's interface - the beauty of the Mac and the power of Onyx in sync.
